

Week 2 Task 7 — Malware Types & Common Attacks

Cybersecurity Internship Project Report

This report covers malware types, common cyber attacks, ransomware, defensive detection indicators, and practical TryHackMe evidence.

1. Malware Types

Type	Definition
Virus	Malicious code that attaches to a legitimate file/program and executes when the host runs.
Worm	Malware that can self-propagate across systems or networks.
Trojan	Malware disguised as legitimate software or content.
Ransomware	Malware that denies access to data/systems, commonly through encryption, and demands payment.
Spyware	Malware that secretly monitors activity or collects information.
Rootkit	Malicious tools designed to hide activity and maintain privileged access.

2. Common Attacks and Detection

Attack	Mechanism	Detection sign
Phishing	Deceptive messages/sites trick victims into unsafe actions.	Suspicious sender, URL, attachment, or login page.
DoS/DDoS	Overwhelms a service with excessive traffic/requests.	Traffic spike, repeated requests, service degradation.
Brute Force	Repeatedly attempts credentials until successful.	Many failed authentication events in a short period.
MITM	Intercepts or manipulates communication between parties.	Certificate, DNS, ARP, or routing anomalies.

3. Ransomware

Ransomware can spread through phishing, malicious downloads, compromised credentials, or exploited vulnerabilities. Its impact can include file inaccessibility, operational downtime, recovery costs, and possible data exposure.

Introduction

Our existence in a digital world makes it imperative that we understand and can protect against common attacks.

This room will discuss some of the most common techniques used by attackers to target people online. It will also teach some of the best ways to prevent the success of each technique.

Without further ado, let's begin!

5. Conclusion

The project developed practical understanding of malware categories, common attacks, ransomware risks, and useful defensive detection indicators. Both required TryHackMe rooms were completed and documented with the supplied screenshots.
